

AMENDMENT OF CLAIMS:

Amend Claim 1 as follows:

1. (Currently Amended) A razor comprising a blade unit carrying structure on which a blade unit is permanently or detachably mounted for pivotal movement relative to the blade unit carrying structure about a predetermined pivot axis extending longitudinally through the blade unit, and a delivery system for conducting a fluid dispensed from a reservoir connected to the blade unit carrying structure to at least one discharge port, wherein the discharge port has an opening located at or close to the predetermined pivot axis of the blade unit for discharging the fluid through said opening directly to the skin ~~to the blade unit at a guard surface~~ at or near the predetermined pivot axis.

Cancel Claim 8.

Amend Claim 15 as follows.

15. (Currently Amended) A razor as defined in claim 13 14, wherein the supporting structure comprises a ring to which the blade unit carrying structure is integrally connected by a pair of laterally opposed webs.

Add the following claims.

25. (New) A razor according to claim 1, wherein the discharge port is defined by a tubular member, and the blade unit includes an elastomeric element surrounding and sealing against the tubular member adjacent the discharge port.

26. (New) A razor according to claim 1, wherein the discharge port is defined by a tubular member extending through said blade unit and terminating at a position at or adjacent to the pivot axis of the blade unit for discharging the fluid directly to the skin.

27. (New) A razor according to claim 26, wherein the blade unit includes an elastomeric element surrounding and sealing against the tubular member adjacent the discharge port.

28. (New) A razor comprising a blade unit carrying structure on which a blade unit is permanently or detachably mounted for pivotal movement relative to the blade unit carrying structure about a predetermined pivot axis extending longitudinally through the blade unit, and a delivery system for conducting a fluid dispensed from a reservoir connected to the blade unit carrying structure to at least one discharge port, wherein the discharge port has an opening located at or close to the predetermined pivot axis for discharging the fluid to the blade unit at a guard surface at or near the predetermined pivot axis, and wherein the discharge port is defined by a tubular member, and the blade unit includes an elastomeric skin contacting element having a lip surrounding and sealing against the tubular member adjacent the discharge port.
